Board meeting date: July 28, 2020  
Item number: 3

Comment/questions

1. We are getting a lot of inconsistent answers from the PHD when we call for guidance about an employee possible exposure. Our employees work with elderly clients one on one in their own homes and each employee wears gloves and a mask the entire time they are with the elderly client. If the employee is exposed under these circumstances, why would they need to self quarantine for 14 days? Nurses taking care of COVID positive patients in a hospital don't self quarantine for 14 days after a shift.
2. If a person tests positive for COVID and is retested and the retest is also positive, is each of these counted as a separate positive case thereby erroneously inflating our number of COVID positive cases?

Best Regards,  
Tami
